

Asset Management Strategy

Develop Kingston's highway asset management strategy (HAMS), supporting tools and, investment business case through carriageway and footway condition data collected.

OUR APPROACH.

- Work with the planned and responsive maintenance teams at Kingston to understand the Council's current asset management practices.
- Collect asset condition data using a bespoke cycle-survey specification to inform supporting HAMS tools.
- Develop further asset management processes to improve on the current practices going forward such as, investment modelling and lifecycle planning.
- Engage with the relevant stakeholders at key stages throughout the project to ensure the HAMS is owned and adopted by both planned and responsive maintenance teams.

PROJECT OUTCOMES.

- Through this project, Sutton Kingston has:
- A concise HAMS documenting the Council's asset management practices aligned to the UKRLG/HMEP Highway Infrastructure Asset Management Guidance, 2013 document.
- Improved asset knowledge, condition data and process documentation.
- A robust business case to support their bid to increase Council capital funding for carriageways and footways.
