

Asset Condition Surveys

Simplifying information so we can explain asset condition to stakeholders. Metis' mobile cycle survey provides a quick, cost effective assessment of the network.

OUR APPROACH.

- Metis developed a mobile App that enables highway asset condition data to be captured from a bike, on foot or by vehicle.
- Established a relative road condition on client set parameters.
- Provided instant access to client to ensure transparency.
- Developed a priority scheme list based on hierarchy and asset functionality – parameters set by the client.
- Provided a map based scheme list to enable senior managers and Members to visualise where the asset is in need of investment.

PROJECT OUTCOMES.

Through this project, London Borough of Tower Hamlets has been engaged in the condition data being collected both through the online viewer and regular reporting from Metis. This has engendered:

- Transparent decision making process and improved local accountability.
- Time efficient and fully auditable.
- Scheme list reprioritised to meet community and engineering need.
- From start of survey to prioritized scheme list in just 4 weeks.

WHAT THE CLIENT SAYS.

"We weren't getting what we needed from traditional road surveys. Metis offered their fresh approach and the outcome was quick and usable immediately. I can now show my poor roads on a map without any expensive software"
